

EDUCATION

University of Western Ontario || London, Ontario
Bachelor of Engineering Science – Software Engineering

June 2026

TECHNICAL SKILLS

- Programming Languages: Python, Java, JavaScript, SQL, PHP, C#, C++
- Tools & Project Management: Claude Code, Cursor, VS Code, GitHub, Jira, Confluence, Bitbucket,
- Cloud & DevOps: AWS (EC2, IAM, S3, Cloud Deployment), Google Cloud, Docker, GitHub Actions
- Frameworks & Web Technologies: React, React Native, Node.js, Express.js, Laravel, Filament, HTML, CSS
- Databases: MySQL, PostgreSQL, MongoDB, YugabyteDB, SQL Query Optimization, Eloquent ORM (Laravel)
- Training & Certificates: AWS Certified Solutions Architect-Associate, AWS Certified Cloud Practitioner

EXPERIENCE

HorizoonX: *Frontend Engineer Intern* - Al Khobar, Saudi Arabia

June 2025 – August 2025

- Developed and maintained 10+ production features across three Laravel applications (HorizoonX, Terhali, Keyss) using PHP, JavaScript, Filament, and Livewire, supporting workflows and production releases.
- Investigated and resolved 20+ application issues through debugging, QA testing, SQL-based data validation across MySQL and PostgreSQL, and peer code reviews, improving production stability and software quality.
- Built Filament admin panels for the Terhali application, giving operations teams a centralized interface to manage users, records, and day-to-day workflows without engineering support.
- Enhanced UI/UX and developed bilingual (English/Arabic) interfaces, improving accessibility and a diverse user experience.
- Collaborated with developers, operations teams, and project stakeholders to gather feedback, refine requirements, and deliver features aligned with business needs.

TechBay Solutions: *Sales Intern* - Oakville, Ontario

May 2024 – Sept. 2024

- Supported the sales team in lead generation, client outreach, and marketing of technological safety products and services.
- Assisted in creating 15+ pitch decks and one-pagers, contributing to improved client engagement and deal flow.

PROJECTS

[EcoLogic AI – Sustainability Management Platform](#) | [GitHub](#)

- Developed a full-stack sustainability platform using React, Node.js, Express, and PostgreSQL, enabling restaurant owners to track carbon emissions, food waste, and operational sustainability in real time.
- Integrated the OpenAI API with a structured context pipeline (menu emissions, facility data, waste metrics) to generate personalized sustainability recommendations, backed by a rule-based fallback for reliable output when the API is unavailable.
- Designed a rule-based risk scoring algorithm (0–100) and a heuristic PDF parsing engine for automated menu import, reducing manual data entry and surfacing actionable, interpretable insights.
- Engineered RESTful APIs, JWT-based authentication, and a centralized emissions-calculation pipeline over a PostgreSQL database, collaborating within a 5-member Agile team across the full SDLC.

Data Care Health App | [GitHub](#)

- Built a cross-platform (iOS/Android) patient-management app using Expo/React Native, with a containerized Node.js/Express backend (Docker) deployed to Google Cloud Run and a YugabyteDB distributed SQL database, developed collaboratively across a 4-person Agile team.
- Containerized the Node.js/Express backend, authoring a production Dockerfile and environment configuration to enable deployment to Google Cloud Run.
- Configured environment variables and API base URLs to connect the Expo frontend to the containerized backend, ensuring reliable connectivity across development and production environments.
- Designed early UI wireframes for patient-intake, appointment, and questionnaire workflows during initial sprint planning, and debugged issues in the patient-record editing interface throughout the SDLC.

Online Banking System | [GitHub](#)

- Developed a secure online banking system using C++, Boost.Beast, and PostgreSQL to manage user accounts and financial transactions.
- Implemented RESTful APIs for deposits, withdrawals, transfers, authentication, and balance inquiries while ensuring reliable database integration.
- Applied object-oriented design principles and modern C++ development practices to build scalable and maintainable software components.
- Utilized Git version control and collaborative development workflows while designing secure transaction handling and account management features.
